# Interesting Trends

- ❑ **In 2015 alone, the world will produce data equal to 120,000 times the total of all previously written words in history.** This data will be generated by exponentially more powerful computing, stored in the cloud and accessible from a growing range of devices.
- ❑ **The second is a shift towards personalization.** All consumer trends point towards greater customization for individuals needs. Websites like Amazon track shopping habits and recommend goods accordingly, while other online services only display content or updates relevant to specific needs.
- ❑ **Third is that technology is more social than ever before.** Networks such as Facebook, now the most visited site in the US, have helped establish interlinked communities of users. Consumers increasingly create their own content in addition to accessing what has been created by others. Social networks are not just a place to find friends.
